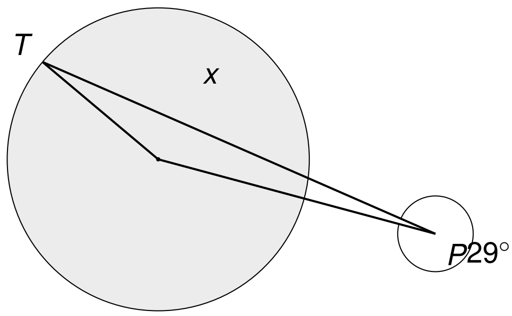
1 A satellite dish is supported by a circular collar that fits around a cylindrical mast. O is the centre of the circular cross-section of the collar, and T is the point where a straight support strut touches the collar.

The strut TP is a tangent to the circle at T, and OP is a straight brace connecting the centre O to a fixing point P on the strut.



Angle $OPT = 29°$.

Work out the size of angle x, the angle between the radius OT and the brace OP.

x = ... °
