

- 1** A satellite tracking station uses a circular dish. Two straight support cables run from an external anchor point P on the ground to the points A and B on the rim of the dish, each cable touching the circular rim as a tangent. The centre of the dish is O .
- Given that OA and OB are radii, angle $OAP = 90^\circ$, angle $OBP = 90^\circ$, and angle $APB = 38^\circ$, find the size of angle AOB .

$$AOB = \dots\dots\dots^\circ$$
